

# Textures

Textures redefine the tactile and visual experience of the product. The textures offer a reliable and functional solution for different interior or exterior stair tread, plank, or deck applications.

## STANDARD TEXTURE:

The standard texture is the most affordable and popular option. This finish resembles the concrete look. The orange peel-like texture withstands high foot traffic, vehicle use, and machinery use. It is ideal for residential, commercial, and industrial applications. The texture is naturally highly slip-resistant, exceeding slip rating requirements dry or wet.

### GROOVED TEXTURE:

Additional costs and lead time apply—a product modification made to the standard texture after the precast process. A highly abrasive ribbed / bar grating-like effect creates grooves which promotes drainage to the left and right. The grooves can be placed at the leading edge for stair tread abrasive nosing or through the top face. This texture withstands high foot traffic without wear and greatly enhances slip rating. It is ideal for industrial stairs, ships ladders, landings, platforms, and planking, where high slip resistance for walking is required.

### EMBOSSED WOOD GRAIN TEXTURE:

Additional costs and lead time apply—an embossed wood grain modification to the standard texture after the precast process. This texture is only available for up to 12" broad profiles. Embossment depth may vary due to product tolerances. It is not recommended for high-use applications. This texture is for mid to low-use residential stairs, landings, and decks.
